NEW QUESTION 101
- (Exam Topic 5)
Your network contains an Active Directory domain named adatum.com that is synced to Azure AD. The domain contains 100 user accounts.
The city attribute for all the users is set to the city where the user resides.
You need to modify the value of the city attribute to the three-letter airport code of each city. What should you do?

A. From Windows PowerShell on a domain controller, run the Gec-ADUser and Sec-ADUser cmdlets.

B. From Azure Cloud Shell, run the Gec-ADUser and Sec-ADUser cmdlets.
C. From Windows PowerShell on a domain controller, run the Gec-MgUser and Updace-MgUser cmdlets.
D. From Azure Cloud Shell, run the Gec-MgUser and Update-MgUser cmdlets.

Answer: A

Explanation:
The user accounts are synced from the on-premise Active Directory to the Microsoft Azure Active Directory (Azure AD). Therefore, the city attribute must be changed in the on-premise Active Directory.
You can use Windows PowerShell on a domain controller and run the Get-ADUser cmdlet to get the required users and pipe the results into Set-ADUser cmdlet to modify the city attribute.
Note:
There are several versions of this question in the exam. The question has two possible correct answers:
* 1. From Windows PowerShell on a domain controller, run the Get-ADUser and Set-ADUser cmdlets.
* 2. From Active Directory Administrative Center, select the Active Directory users, and then modify the Properties settings.
Other incorrect answer options you may see on the exam include the following:
* 1. From the Azure portal, select all the Azure AD users, and then use the User settings blade.
* 2. From Windows PowerShell on a domain controller, run the Get-AzureADUser and Set-AzureADUser cmdlets.
* 3. From the Microsoft 365 admin center, select the users, and then use the Bulk actions option.
* 4. From Azure Cloud Shell, run the Get-ADUser and Set-ADUser cmdlets. Reference:

NEW QUESTION 131
- (Exam Topic 5)
Your on-premises network contains an Active Directory domain. You have a Microsoft 365 subscription.
You need to sync the domain with the subscription. The solution must meet the following requirements: On-premises Active Directory password complexity policies must be enforced.
Users must be able to use self-service password reset (SSPR) in Azure AD.
What should you use?

A. password hash synchronization
B. Azure AD Identity Protection
C. Azure AD Seamless Single Sign-On (Azure AD Seamless SSO)
D. pass-through authentication

Answer: D

Explanation:
Azure Active Directory (Azure AD) Pass-through Authentication allows your users to sign in to both on-premises and cloud-based applications using the same passwords.
This feature is an alternative to Azure AD Password Hash Synchronization, which provides the same benefit of cloud authentication to organizations. However, certain organizations wanting to enforce their on-premises Active Directory security and password policies, can choose to use Pass-through Authentication instead.
Note: Azure Active Directory (Azure AD) self-service password reset (SSPR) lets users reset their passwords in the cloud, but most companies also have an on-premises Active Directory Domain Services (AD DS) environment for users. Password writeback allows password changes in the cloud to be written back to an on-premises directory in real time by using either Azure AD Connect or Azure AD Connect cloud sync. When users change or reset their passwords using SSPR in the cloud, the updated passwords also written back to the on-premises AD DS environment.
Password writeback is supported in environments that use the following hybrid identity models: Password hash synchronization
Pass-through authentication

Your network contains three Active Directory forests. There are forests trust relationships between the forests. You create an Azure AD tenant.
You plan to sync the on-premises Active Directory to Azure AD.
You need to recommend a synchronization solution. The solution must ensure that the synchronization can complete successfully and as quickly as possible if a single server fails.
What should you include in the recommendation?

A. one Azure AD Connect sync server and one Azure AD Connect sync server in staging mode
B. three Azure AD Connect sync servers and one Azure AD Connect sync server in staging mode
C. six Azure AD Connect sync servers and three Azure AD Connect sync servers in staging mode
D. three Azure AD Connect sync servers and three Azure AD Connect sync servers in staging mode

You plan to implement Microsoft Purview Privileged Access Management. Which Microsoft Office 365 workloads support privileged access?

A. Microsoft Exchange Online only
B. Microsoft Teams only
C. Microsoft Exchanqe Online and SharePoint Online only
D. Microsoft Teams and SharePoint Online only

E. Microsoft Teams, Exchanqe Online, and SharePoint Online

Answer: A

Explanation:
Privileged access management
Having standing access by some users to sensitive information or critical network configuration settings in Microsoft Exchange Online is a potential pathway for compromised accounts or internal threat activities. Microsoft Purview Privileged Access Management helps protect your organization from breaches and helps to meet compliance best practices by limiting standing access to sensitive data or access to critical configuration settings. Instead of administrators having constant access, just-in-time access rules are implemented for tasks that need elevated permissions. Enabling privileged access management for Exchange Online in Microsoft 365 allows your organization to operate with zero standing privileges and provide a layer of defense against standing administrative access vulnerabilities.
Note: When will privileged access support Office 365 workloads beyond Exchange? Privileged access management will be available in other Office 365 workloads soon. Reference:

NEW QUESTION 279
- (Exam Topic 5)
You have a Microsoft 365 E5 subscription that contains the following user:
➢ Name: User1
➢ UPN: user1@contoso.com
➢ Email address: user1@marketmg.contoso.com
➢ MFA enrollment status: Disabled
When User1 attempts to sign in to Outlook on the web by using the user1@marketing.contoso.com email address, the user cannot sign in.
You need to ensure that User1 can sign in to Outlook on the web by using user1@marketing.contoso.com. What should you do?

A. Assign an MFA registration policy to User1.
B. Reset the password of User1.
C. Add an alternate email address for User1.
D. Modify the UPN of User1.

Answer: D

Explanation:
Microsoft's recommended best practices are to match UPN to primary SMTP address. This article addresses the small percentage of customers that cannot remediate UPN's to match.
Note: A UPN is an Internet-style login name for a user based on the Internet standard RFC 822. The UPN is shorter than a distinguished name and easier to remember. By convention, this should map to the user's email name. The point of the UPN is to consolidate the email and logon namespaces so that the user only needs to remember a single name.
Configure the Azure AD multifactor authentication registration policy
Azure Active Directory (Azure AD) Identity Protection helps you manage the roll-out of Azure AD multifactor authentication (MFA) registration by configuring a Conditional Access policy to require MFA registration no matter what modern authentication app you're signing in to.

NEW QUESTION 285
- (Exam Topic 5)
HOTSPOT
You have a new Microsoft 365 E5 tenant. Enable Security defaults is set to Yes.
A user signs in to the tenant for the first time.
Which multi-factor authentication (MFA) method can the user use, and how many days does the user have to register for MFA? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.

Answer Area

MFA method:	▼
Call to phone	
Email message	
Security questions	
Text message to phone	
Notification to Microsoft Authenticator app	

Number of days:	▼
7	
14	
30	
60	

A. Mastered
B. Not Mastered

Answer: A

Explanation:
Box 1: Notification to Microsoft Authenticator app
Do users have 14 days to register for Azure AD Multi-Factor Authentication?
Users have 14 days to register for MFA with the Microsoft Authenticator app from their smart phones, which begins from the first time they sign in after security defaults has been enabled. After 14 days have passed, the user won't be able to sign in until MFA registration is completed.
Box 2: 14
Azure AD Identity Protection will prompt your users to register the next time they sign in interactively and they'll have 14 days to complete registration. During this 14-day period, they can bypass registration if MFA isn't required as a condition, but at the end of the period they'll be required to register before they can complete the sign-in process.
